Dear Sirs

European Patent Application No. 04744392.4  
In the name of Koninklijke Philips Electronics N.V.  
For 'Method Of Measuring Sub-Micron Trench Structures'

We respond to the Official Communication pursuant to Article 96(2) EPC dated 28 November 2006. Please find enclosed a set of amended claims on pages numbered 12 and 13 as a replacement for all of the claims of the application on file. In addition, we enclose copies of a replacement for page 3 where the description has been amended to ensure consistency with the claims.

The claims have been amended in the manner indicated on the attached marked-up copy. Specifically, claim 1 has been amended to define a method for measuring an *unfilled* pattern structure, support for which may be found at page 3, lines 1 to 6 as well as in Figures 2a and 2b. The amendment which states 'the pattern comprising features each having a width dimension' is supported by the description at page 3, lines 11 to 12, as well as at page 6, line 21 and in other places throughout the description. The step of 'exciting' has been amended to define 'irradiating the unfilled patterned structure...', support for which can be found at page 3, line 17. This clause of the claims has also been amended to state 'wherein the surface acoustic waves have a wavelength larger than the feature width dimensions'. Support for this amendment can be found at page 7, lines 3 to 4. Finally, the determining step has been amended to recite 'determining a surface acoustic wave phase velocity from the signal wave form and...' support for this amendment can be found at page 6, lines 17 to 19.

Claim 2 is a new claim, dependent on claim 1 and stating that the unfilled patterned structure comprises a plurality of unfilled trenches. Support for this can be found in various places in the description, for example at page 7, lines 1 to 3 and in Figure 2.

The subsequent claims have been renumbered, but are otherwise unamended, save that claims 16 and 17 no longer define 'analysis of the signal wave form', as this expression is redundant due to the amendments of claim 1.

A list of Marks & Clerk Patent and Trade Mark Attorneys partners is available for inspection at 90 Long Acre, London WC2E 9RA.

Marks & Clerk Patent and Trade Mark Attorneys has offices as follows:  
UK: Birmingham Cambridge Cheltenham Edinburgh Glasgow Leeds Leicester Liverpool London Manchester Oxford

Our affiliated overseas firms have offices as follows:  
Overseas: Luxembourg Paris Hong Kong Ottawa

We submit that the claims comply with Article 123 (2) EPC and that no new subject matter has been added.

Regarding the prior art documents D1 to D6, claim 1 has been amended to recite that 'the surface acoustic waves have a wavelength larger than the feature width dimensions'. The prior art discusses measurement techniques in which the feature width dimension of the measured structure is larger than the measurement spot size. With the present invention, the measured structure has a feature width dimension smaller than the surface acoustic wavelength, i.e., smaller than the measurement spot size. In addition, the prior art discusses structures that are filled to form a continuous film rather than remaining as a raised pattern.

According to D1 and D2, a trench profile is measured by scanning the ISTS spot across the trench, as correctly noted by the Examiner. Thus, the trench width must be larger than the ISTS spot size, and consequently, much larger than the wavelength of the surface acoustic waves, because in ISTS the spot size is always larger than the acoustic wavelength. The method described in D1 and D2 is not applicable to the measurement of submicron trenches used in the current state-of-the-art microelectronics. Note, for example, that the trench width in D2, Figure 3 is 250µm.

With the present invention, the trench width must be smaller than the acoustic wavelength, and consequently much smaller than the spot size. The measurement spot covers many trenches. Thus, the method is capable of measuring submicron trenches. A further advantage of the present invention is that the method may be used to measure trenches fabricated in a bulk material (e.g. in a silicon substrate), while the prior art method described in D1 and D2 is only applicable to trenches fabricated in thin film.

References D3 to D6 describe measurements of arrays of metal lines embedded in a dielectric film (also referred to as damascene arrays). Damascene arrays are fabricated by forming trenches in a dielectric thin film, filling the trenches with metal and removing the excess metal from the surface by a polishing process. Thus, the line arrays described in D3 to D6 are typically characterised by a smooth, polished surface. The measurement principle in D3 to D6 is similar to conventional ISTS measurements of thin films in that it is based on the dependence of the surface acoustic wave velocity on the thickness of a thin film structure. Note that even if the damascene array has a surface topography (e.g. due to a non-perfect polishing process), the method described in D3 to D6 does not measure this topography, but rather the thickness of the array.

In the method of the present invention, the measurement is based on an entirely different physical phenomenon - i.e. the dependence of the surface acoustic wave velocity on the surface profile rather than on the film thickness. Consequently, the inventive method can be applied to the measurement of unfilled trench structures. In addition, the unfilled trenches may be fabricated in a silicon substrate with no thin films present.

In light of the above, we submit that the invention defined in claim 1 is both novel and contains an inventive step.

In light of the above it is believed that the objections raised have been overcome and that the application should now be in a suitable condition for grant. Should the Examiner wish to raise any

further matters we request that these be dealt with in writing or by telephone. Should the Examiner be minded to refuse the application, we request that this is not done until we are first given an opportunity for Oral Proceedings.

Yours faithfully

**Thomas R. Somervell**  
European Patent Attorney  
**MARKS & CLERK**  
E-mail: [tsomervell@marks-clerk.com](mailto:tsomervell@marks-clerk.com)

Marked-Up Amendments to claims

1. A method for measuring an unfilled patterned structure, the pattern comprising features each having a width dimension, the method comprising:

irradiating the unfilled patterned structure with a spatially periodic laser intensity pattern in order to excite generate surface acoustic waves, wherein the surface acoustic waves have a wavelength larger than the feature width dimensions;

diffracting a probe laser beam off the generated surface acoustic waves to form a signal beam;

detecting the signal beam as a function of time to generate a signal waveform; and

determining a surface acoustic wave phase velocity from the signal waveform; and

determining at least one property of the patterned structure based on the effect of the surface profile on the surface acoustic wave phase velocity.

2. The method of Claim 1, wherein the unfilled patterned structure comprises a plurality of unfilled trenches.

3. 2. The method of Claim 1, wherein the exciting step further comprises a spatially periodic laser intensity pattern having a period ranging from 1 to 20 microns.

4. 3. The method of Claim 2 +, wherein the unfilled patterned structure comprises trenches equal to or less than approximately 2  $\mu$ m in width.

5. 4. The method of Claim 4 3, wherein the unfilled patterned structure further comprises a periodic array of trenches.

6. 5. The method of Claim 5 4, wherein the unfilled patterned structure further comprises a periodic array of linear trenches.

7. 6. The method of Claim 5 4, wherein the unfilled patterned structure further comprises a two-dimensional periodic array of trenches.

8 7. The method of Claim 5 4, wherein the trenches are fabricated in a silicon substrate.

9 8. The method of Claim 4 3, wherein the trenches are fabricated in a thin film.

10 9. The method of Claim 2 4, wherein the at least one property comprises trench depth.

11 10. The method of Claim 2 4, wherein the at least one property comprises trench width.

12 11. The method of Claim 1, wherein the at least one property comprises a depth profile of the unfilled patterned trench structure.

13 12. The method of Claim 1, wherein the determining step further comprises combining measurements at multiple acoustic wavelengths to determine multiple parameters of the unfilled patterned trench structure.

14 13. The method of Claim 6 5, wherein the determining step further comprises combining measurements along and across the trench structure to determine both trench depth and width.

15 14. The method of Claim 1, wherein the determining step further comprises combining measurements within and outside the unfilled patterned trench area to separate the effect on the surface acoustic wave velocity caused by the surface profile from other effects such as film thickness.

16 15. The method of Claim 1, wherein the determining step ~~comprises analysis of the signal waveform with~~ employs a theoretical model based on effective elastic properties of the structure.

17 16. The method of Claim 1, wherein the determining step ~~comprises analysis of the signal waveform with~~ employs a model based on an empirical calibration.

patent 6,256,100, the method described above is applied to measure the effective thickness of composite structures formed of narrow (i. e. micron or submicron width) trenches etched in dielectric material and filled with metal. However, this method had not been applied to measuring trench structures prior to metal filling.

In addition, no studies have been done for high-aspect-ratio sub-micron structures which are of the most interest for practical applications.

Accordingly, it would be desirable to provide a method that can measure trench structures on the order of 0.1  $\mu\text{m}$  in width.

According to the present invention there is provided a method for measuring an unfilled patterned structure as defined in claim 1 below.

The present invention meets the need for a method that can measure trench structures on the order of 0.1  $\mu\text{m}$  at least in one aspect. In one aspect, a method measures a patterned structure. One step of the method is exciting the structure by irradiating it with a spatially periodic laser intensity pattern in order to generate surface acoustic waves. Other steps are diffracting a probe laser beam off a thermal grating to form a signal beam; detecting the signal beam as a function of time to generate a signal waveform; and determining at least one property of the patterned structure based on the effect of the surface profile on surface acoustic wave phase velocity.

Claims

1. A method for measuring an unfilled patterned structure, the pattern comprising features each having a width dimension, the method comprising:
  - irradiating the unfilled patterned structure with a spatially periodic laser intensity pattern in order to excite surface acoustic waves, wherein the surface acoustic waves have a wavelength larger than the feature width dimensions;
  - diffracting a probe laser beam off the generated surface acoustic waves to form a signal beam;
  - detecting the signal beam as a function of time to generate a signal waveform; and
  - determining a surface acoustic wave phase velocity from the signal waveform and at least one property of the patterned structure based on the effect of the surface profile on the surface acoustic wave phase velocity.
2. The method of Claim 1, wherein the unfilled patterned structure comprises a plurality of unfilled trenches.
3. The method of Claim 1, wherein the exciting step further comprises a spatially periodic laser intensity pattern having a period ranging from 1 to 20 microns.
4. The method of Claim 2, wherein the unfilled patterned structure comprises trenches equal to or less than approximately 2  $\mu\text{m}$  in width.
5. The method of Claim 4, wherein the unfilled patterned structure further comprises a periodic array of trenches.
6. The method of Claim 5, wherein the unfilled patterned structure further comprises a periodic array of linear trenches.
7. The method of Claim 5, wherein the unfilled patterned structure further comprises a two-dimensional periodic array of trenches.
8. The method of Claim 5, wherein the trenches are fabricated in a silicon

substrate.

9. The method of Claim 4, wherein the trenches are fabricated in a thin film.
10. The method of Claim 2, wherein the at least one property comprises trench depth.
11. The method of Claim 2, wherein the at least one property comprises trench width.
12. The method of Claim 1, wherein the at least one property comprises a depth profile of the unfilled patterned structure.
13. The method of Claim 1, wherein the determining step further comprises combining measurements at multiple acoustic wavelengths to determine multiple parameters of the unfilled patterned structure.
14. The method of Claim 6 wherein the determining step further comprises combining measurements along and across the trench structure to determine both trench depth and width.
15. The method of Claim 1, wherein the determining step further comprises combining measurements within and outside the unfilled patterned area to separate the effect on the surface acoustic wave velocity caused by the surface profile from other effects such as film thickness.
16. The method of Claim 1, wherein the determining step employs a theoretical model based on effective elastic properties of the structure.
17. The method of Claim 1, wherein the determining step employs a model based on an empirical calibration.

27 April 2007

Dear Sirs

**European Patent Application No. 04744392.4**  
**In the name of Koninklijke Philips Electronics N.V.**  
**For 'Method Of Measuring Sub-Micron Trench Structures'**

We respond to the Official Communication pursuant to Article 96(2) EPC dated 28 November 2006. Please find enclosed a set of amended claims on pages numbered 12 and 13 as a replacement for all of the claims of the application on file. In addition, we enclose copies of a replacement for page 3 where the description has been amended to ensure consistency with the claims.

The claims have been amended in the manner indicated on the attached marked-up copy. Specifically, claim 1 has been amended to define a method for measuring an *unfilled* pattern structure, support for which may be found at page 3, lines 1 to 6 as well as in Figures 2a and 2b. The amendment which states 'the pattern comprising features each having a width dimension' is supported by the description at page 3, lines 11 to 12, as well as at page 6, line 21 and in other places throughout the description. The step of 'exciting' has been amended to define 'irradiating the unfilled patterned structure...', support for which can be found at page 3, line 17. This clause of the claims has also been amended to state 'wherein the surface acoustic waves have a wavelength larger than the feature width dimensions'. Support for this amendment can be found at page 7, lines 3 to 4. Finally, the determining step has been amended to recite 'determining a surface acoustic wave phase velocity from the signal wave form and...' support for this amendment can be found at page 6, lines 17 to 19.

Claim 2 is a new claim, dependent on claim 1 and stating that the unfilled patterned structure comprises a plurality of unfilled trenches. Support for this can be found in various places in the description, for example at page 7, lines 1 to 3 and in Figure 2.

The subsequent claims have been renumbered, but are otherwise unamended, save that claims 16 and 17 no longer define 'analysis of the signal wave form', as this expression is redundant due to the amendments of claim 1.

A list of Marks & Clerk Patent and Trade Mark Attorneys partners is available for inspection at 90 Long Acre, London WC2E 9RA.

## MARKS & CLERK

Page 2 of 3 (continued)

We submit that the claims comply with Article 123 (2) EPC and that no new subject matter has been added.

Regarding the prior art documents D1 to D6, claim 1 has been amended to recite that 'the surface acoustic waves have a wavelength larger than the feature width dimension'. The prior art discusses measurement techniques in which the feature width dimension of the measured structure is larger than the measurement spot size. With the present invention, the measured structure has a feature width dimension smaller than the surface acoustic wavelength, i.e., smaller than the measurement spot size. In addition, the prior art discusses structures that are filled to form a continuous film rather than remaining as a raised pattern.

According to D1 and D2, a trench profile is measured by scanning the ISTS spot across the trench, as correctly noted by the Examiner. Thus, the trench width must be larger than the ISTS spot size, and consequently, much larger than the wavelength of the surface acoustic waves, because in ISTS the spot size is always larger than the acoustic wavelength. The method described in D1 and D2 is no applicable to the measurement of submicron trenches used in the current state-of-the-art microelectronics. Note, for example, that the trench width in D2, Figure 3 is 250µm.

With the present invention, the trench width must be smaller than the acoustic wavelength, and consequently much smaller than the spot size. The measurement spot covers many trenches. Thus, the method is capable of measuring submicron trenches. A further advantage of the present invention is that the method may be used to measure trenches fabricated in a bulk material (e.g. in a silicon substrate), while the prior art method described in D1 and D2 is only applicable to trenches fabricated in thin film.

References D3 to D6 describe measurements of arrays of metal lines embedded in a dielectric film (also referred to as damascene arrays). Damascene arrays are fabricated by forming trenches in a dielectric thin film, filling the trenches with metal and removing the excess metal from the surface by a polishing process. Thus, the line arrays described in D3 to D6 are typically characterised by a smooth, polished surface. The measurement principle in D3 to D6 is similar to conventional ISTS measurements of thin films in that it is based on the dependence of the surface acoustic wave velocity on the thickness of a thin film structure. Note that even if the damascene array has a surface topography (e.g. due to a non-perfect polishing process), the method described in D3 to D6 does not measure this topography, but rather the thickness of the array.

In the method of the present invention, the measurement is based on an entirely different physical phenomenon - i.e. the dependence of the surface acoustic wave velocity on the surface profile rather than on the film thickness. Consequently, the inventive method can be applied to the measurement of unfilled trench structures. In addition, the unfilled trenches may be fabricated in a silicon substrate with no thin films present.

In light of the above, we submit that the invention defined in claim 1 is both novel and contains an inventive step.

In light of the above it is believed that the objections raised have been overcome and that the application should now be in a suitable condition for grant. Should the Examiner wish to raise any

patent 6,256, 100, the method described above is applied to measure the effective thickness of composite structures formed of narrow (i. e. micron or submicron width) trenches etched in dielectric material and filled with metal. However, this method had not been applied to measuring trench structures prior to metal filling.

In addition, no studies have been done for high-aspect- ratio sub-micron structures which are of the most interest for practical applications.

Accordingly, it would be desirable to provide a method that can measure trench structures on the order of 0.1  $\mu\text{m}$  in width.

According to the present invention there is provided a method for measuring an unfilled patterned structure as defined in claim 1 below.

The present invention meets the need for a method that can measure trench structures on the order of 0.1  $\mu\text{m}$  at least in one aspect. In one aspect, a method measures a patterned structure. One step of the method is exciting the structure by irradiating it with a spatially periodic laser intensity pattern in order to generate surface acoustic waves. Other steps are diffracting a probe laser beam off a thermal grating to form a signal beam; detecting the signal beam as a function of time to generate a signal waveform; and determining at least one property of the patterned structure based on the effect of the surface profile on surface acoustic wave phase velocity.

Marked-Up Amendments to claims

1. A method for measuring an unfilled patterned structure, the pattern comprising features each having a width dimension, the method comprising:

irradiating the unfilled patterned exciting the structure with a spatially periodic laser intensity pattern in order to excite generate surface acoustic waves, wherein the surface acoustic waves have a wavelength larger than the feature width dimensions; diffracting a probe laser beam off the generated surface acoustic waves to form a signal beam;

detecting the signal beam as a function of time to generate a signal waveform; and

determining a surface acoustic wave phase velocity from the signal waveform; and

determining at least one property of the patterned structure based on the effect of the surface profile on the surface acoustic wave phase velocity.

2. The method of Claim 1, wherein the unfilled patterned structure comprises a plurality of unfilled trenches.

3 2. The method of Claim 1, wherein the exciting step further comprises a spatially periodic laser intensity pattern having a period ranging from 1 to 20 microns.

4 3. The method of Claim 2 4, wherein the unfilled patterned structure comprises trenches equal to or less than approximately 2  $\mu\text{m}$  in width.

5 4. The method of Claim 4 3, wherein the unfilled patterned structure further comprises a periodic array of trenches.

6 5. The method of Claim 5 4, wherein the unfilled patterned structure further comprises a periodic array of linear trenches.

7 6. The method of Claim 5 4, wherein the unfilled patterned structure further comprises a two-dimensional periodic array of trenches.

8 7. The method of Claim 5 4, wherein the trenches are fabricated in a silicon substrate.

9 8. The method of Claim 4 3, wherein the trenches are fabricated in a thin film.

10 9. The method of Claim 2 4, wherein the at least one property comprises trench depth.

11 10. The method of Claim 2 4, wherein the at least one property comprises trench width.

12 11. The method of Claim 1, wherein the at least one property comprises a depth profile of the unfilled patterned trench structure.

13 12. The method of Claim 1, wherein the determining step further comprises combining measurements at multiple acoustic wavelengths to determine multiple parameters of the unfilled patterned trench structure.

14 13. The method of Claim 6 5, wherein the determining step further comprises combining measurements along and across the trench structure to determine both trench depth and width.

15 14. The method of Claim 1, wherein the determining step further comprises combining measurements within and outside the unfilled patterned trench area to separate the effect on the surface acoustic wave velocity caused by the surface profile from other effects such as film thickness.

16 15. The method of Claim 1, wherein the determining step ~~comprises analysis of the signal waveform with employs~~ a theoretical model based on effective elastic properties of the structure.

17 16. The method of Claim 1, wherein the determining step ~~comprises analysis of the signal waveform with employs~~ a model based on an empirical calibration.

Claims

1. A method for measuring an unfilled patterned structure, the pattern comprising features each having a width dimension, the method comprising:
  - irradiating the unfilled patterned structure with a spatially periodic laser intensity pattern in order to excite surface acoustic waves, wherein the surface acoustic waves have a wavelength larger than the feature width dimensions;
  - diffracting a probe laser beam off the generated surface acoustic waves to form a signal beam;
  - detecting the signal beam as a function of time to generate a signal waveform; and
  - determining a surface acoustic wave phase velocity from the signal waveform and at least one property of the patterned structure based on the effect of the surface profile on the surface acoustic wave phase velocity.
2. The method of Claim 1, wherein the unfilled patterned structure comprises a plurality of unfilled trenches.
3. The method of Claim 1, wherein the exciting step further comprises a spatially periodic laser intensity pattern having a period ranging from 1 to 20 microns.
4. The method of Claim 2, wherein the unfilled patterned structure comprises trenches equal to or less than approximately 2  $\mu\text{m}$  in width.
5. The method of Claim 4, wherein the unfilled patterned structure further comprises a periodic array of trenches.
6. The method of Claim 5, wherein the unfilled patterned structure further comprises a periodic array of linear trenches.
7. The method of Claim 5, wherein the unfilled patterned structure further comprises a two-dimensional periodic array of trenches.
8. The method of Claim 5, wherein the trenches are fabricated in a silicon

substrate.

9. The method of Claim 4, wherein the trenches are fabricated in a thin film.

10. The method of Claim 2, wherein the at least one property comprises trench depth.

11. The method of Claim 2, wherein the at least one property comprises trench width.

12. The method of Claim 1, wherein the at least one property comprises a depth profile of the unfilled patterned structure.

13. The method of Claim 1, wherein the determining step further comprises combining measurements at multiple acoustic wavelengths to determine multiple parameters of the unfilled patterned structure.

14. The method of Claim 6 wherein the determining step further comprises combining measurements along and across the trench structure to determine both trench depth and width.

15. The method of Claim 1, wherein the determining step further comprises combining measurements within and outside the unfilled patterned area to separate the effect on the surface acoustic wave velocity caused by the surface profile from other effects such as film thickness.

16. The method of Claim 1, wherein the determining step employs a theoretical model based on effective elastic properties of the structure.

17. The method of Claim 1, wherein the determining step employs a model based on an empirical calibration.

#### Communication

concerning the registration of amendments relating to

a transfer (Rules 20 and 61 EPC)  
 entries pertaining to the applicant/the proprietor (Rule 92(1)(f) EPC)

As requested, the entries pertaining to the applicant of the above-mentioned European patent application / to the proprietor of the above-mentioned European patent have been amended to the following:

AT BE BG CH CY CZ DE DK EE ES FI FR GB GR HU IE IT LI LU MC NL PL PT  
RO SE SI SK TR  
Advanced Metrology Systems, LLC  
12 Michigan Drive  
Natick, MA 01760/US

The registration of the changes has taken effect on 12.03.07.

In the case of a published application/a patent, the change will be recorded in the Register of European Patents and published in the European Patent Bulletin (Section I.12/II.12).

Your attention is drawn to the fact that, in the case of the registration of a transfer, any automatic debit order only ceases to be effective from the date of its express revocation (cf. point 14(c) of the Arrangements for the automatic debiting procedure, Supplement to OJ EPO 2/2002).

**NOTICE OF  
PATENT AND PATENT APPLICATION ASSIGNMENT**

Effective Date: October 5th, 2006

**WHEREAS**, Koninklijke Philips Electronics N.V., a corporation organized and existing under the laws of The Netherlands ("Assignor"), is the owner of the inventions listed on Schedule A (collectively, the "Inventions") for which applications for United States Patents were filed and issued (collectively, the "Patents" and "Patent Applications"); and

**WHEREAS**, Advanced Metrology Systems LLC, a limited-liability company organized and existing under the laws of the State of Delaware ("Assignee"), is desirous of obtaining the entire right, title and interest in, to and under the Inventions, the Patents, the Patent Applications, and any patents which have been or may be granted therefrom, effective as of the Effective Date hereof; and

**WHEREAS**, Assignee has entered into a Class A and Class B Units Purchase Agreement by and among Philips Electronics North America Corporation, an affiliate of Assignor ("PENAC"), Philips Advanced Metrology Systems, Inc., another affiliate of Assignor ("PAMS"), JHW Greentree Capital, L.P., Advanced Metrology Systems Holdings LLC ("Holdings LLC") and Assignee dated as of October 5, 2006 (the "Purchase Agreement") pursuant to which Holdings LLC and its subsidiary, the Assignee, have agreed to purchase from PAMS and its affiliates, and PAMS and PENAC have agreed to cause the transfer to Assignee, among other things, all of the Assignor's right, title and interests in the Inventions, the Patents, the Patent Applications, and any patents which have been or may be granted therefrom;

**NOW, THEREFORE**, in consideration of the premises set forth above and in the Purchase Agreement and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged:

1. Assignor hereby sells, assigns, transfers and sets over to Assignee, its successors, legal representatives and assigns, the entire right, title and interest in and to (i) the Inventions, and the Applications and all divisions, renewals and continuations thereof, and all Patents of the United States which have been or may be granted thereon and all reissues and extensions thereof; (ii) all applications for industrial property protection, including, without limitation, all applications for patents, utility models, and designs which may hereafter be filed for the Invention in any country or countries foreign to the United States, together with the right to file such applications and the right to claim for the same the priority rights derived from the Application under the Patent Laws of the United States, the International Convention for the Protection of Industrial Property, or any other international agreement or the domestic laws of the country in which any such application is filed, as may be applicable; and all forms of industrial property protection, including, without limitation, patents, utility models, inventors' certificates and designs which may be granted for the Invention in any country or countries foreign to the United States and all extensions, renewals and reissues thereof; (iii) the right to sue or otherwise recover for any infringements thereof, (iv) all income, royalties, damages and other payments now and hereafter due and/or payable with respect thereto (including, without limitation, payments under all licenses entered into in connection therewith, and damages and payments for past and future infringements thereof).

2. Assignor hereby authorizes and requests the Commissioner of Patents and Trademarks of the United States, and any official of any country or countries foreign to the United States whose duty it is to issue patents or other evidence or forms of industrial property protection on applications as aforesaid, to issue the same to the Assignee, its successors, legal representatives and assigns, in accordance with the terms of this instrument and the Purchase Agreement.

IN WITNESS WHEREOF, the parties hereto have caused this Assignment to be executed by their respective duly authorized representatives as of the Effective Date.

ASSIGNOR:

Koninklijke Philips Electronics N.V.

By:

**NOTICE OF**  
**PATENT AND PATENT APPLICATION ASSIGNMENT**

Effective Date: October 5th, 2006

WHEREAS, Koninklijke Philips Electronics N.V., a corporation organized and existing under the laws of The Netherlands ("Assignor"), is the owner of the inventions listed on Schedule A (collectively, the "Inventions") for which applications for United States Patents were filed and issued (collectively, the "Patents" and "Patent Applications"); and

WHEREAS, Advanced Metrology Systems LLC, a limited liability company organized and existing under the laws of the State of Delaware ("Assignee"), is desirous of obtaining the entire right, title and interest in, to and under the Inventions, the Patents, the Patent Applications, and any patents which have been or may be granted therefrom, effective as of the Effective Date hereof; and

WHEREAS, Assignee has entered into a Class A and Class B Units Purchase Agreement by and among Philips Electronics North America Corporation, an affiliate of Assignor ("PENAC"), Philips Advanced Metrology Systems, Inc., another affiliate of Assignor ("PAMS"), JHW Greentree Capital, L.P., Advanced Metrology Systems Holdings LLC ("Holdings LLC") and Assignee dated as of October 5, 2006 (the "Purchase Agreement") pursuant to which Holdings LLC and its subsidiary, the Assignee, have agreed to purchase from PAMS and its affiliates, and PAMS and PENAC have agreed to cause the transfer to Assignee, among other things, all of the Assignor's right, title and interests in the Inventions, the Patents, the Patent Applications, and any patents which have been or may be granted therefrom;

NOW, THEREFORE, in consideration of the premises set forth above and in the Purchase Agreement and for other good and valuable consideration, the receipt and sufficieacy of which are hereby acknowledged:

1. Assignor hereby sells, assigns, transfers and sets over to Assignee, its successors, legal representatives and assigns, the entire right, title and interest in and to (i) the Inventions, and the Applications and all divisions, renewals and continuations thereof, and all Patents of the United States which have been or may be granted thereon and all reissues and extensions thereof; (ii) all applications for industrial property protection, including, without limitation, all applications for patents, utility models, and designs which may hereafter be filed for the Invention in any country or countries foreign to the United States, together with the right to file such applications and the right to claim for the same the priority rights derived from the Application under the Patent Laws of the United States, the International Convention for the Protection of Industrial Property, or any other international agreement or the domestic laws of the country in which any such application is filed, as may be applicable; and all forms of industrial property protection, including, without limitation, patents, utility models, inventors' certificates and designs which may be granted for the Invention in any country or countries foreign to the United States and all extensions, renewals and reissues thereof; (iii) the right to sue or otherwise recover for any infringements thereof, (iv) all income, royalties, damages and other payments now and hereafter due and/or payable with respect the reto (including, without limitation, payments under all licenses entered into in connection therewith, and damages and payments for past and future infringements thereof).

2. Assignor hereby authorizes and requests the Commissioner of Patents and Trademarks of the United States, and any official of any country or countries foreign to the United States whose duty it is to issue patents or other evidence or forms of industrial property protection on applications as aforesaid, to issue the same to the Assignee, its successors, legal representatives and assigns, in accordance with the terms of this instrument and the Purchase Agreement.

IN WITNESS WHEREOF, the parties hereto have caused this Assignment to be executed by their respective duly authorized representatives as of the Effective Date.

Dear Sirs

**European Patent Application No. 04744392.4**  
In the name of Koninklijke Philips Electronics N.V.  
For 'Method Of Measuring Sub-Micron Trench Structures'

Please be advised that with immediate effect, the writer has taken over responsibility for this European patent application in place of Julius Simon Cohen of Philips Intellectual Property & Standards.

Yours faithfully

**Sean J. Hackett**  
European Patent Attorney  
**MARKS & CLERK**

Applicant Koninklijke Philips Electronics N.V.		

**Communication pursuant to Article 96(2) EPC**

The examination of the above-identified application has revealed that it does not meet the requirements of the European Patent Convention for the reasons enclosed herewith. If the deficiencies indicated are not rectified the application may be refused pursuant to Article 97(1) EPC.

You are invited to file your observations and insofar as the deficiencies are such as to be rectifiable, to correct the indicated deficiencies within a period

of 4 months

from the notification of this communication, this period being computed in accordance with Rules 78(2) and 83(2) and (4) EPC.

One set of amendments to the description, claims and drawings is to be filed within the said period on separate sheets (Rule 36(1) EPC).

**Failure to comply with this invitation in due time will result in the application being deemed to be withdrawn (Article 96(3) EPC).**

#### Notification of European publication number and information on the application of Article 67(3) EPC

The provisional protection under Article 67(1) and (2) EPC in the individual contracting states becomes effective only when the conditions referred to in Article 67(3) EPC have been fulfilled (for further details, see information brochure of the European Patent Office "National Law relating to the EPC" and additional information in the Official Journal of the European Patent Office).

Pursuant to Article 158(1) EPC the publication under Article 21 PCT of an international application for which the European Patent Office is a designated Office takes the place of the publication of a European patent application.

The bibliographic data of the above-mentioned Euro-PCT application will be published on 29.03.06 in Section I.1 of the European Patent Bulletin. The European publication number is 1639344.

In all future communications to the European Patent Office, please quote the application number plus Directorate number.

#### Communication pursuant to Rules 109 and 110 EPC

##### (1) Amendment of application documents, especially the claims (R. 109 EPC)

The above mentioned international (Euro-PCT) application has entered the European phase, or can do so, once the necessary conditions are fulfilled.

Under Articles 28, 41 PCT, Rules 52, 78 PCT and Rule 86(2) to (4) EPC, the applicant may amend the application documents after receiving the international search report.

Whether or not he has already done so, he now has a further opportunity to file amended claims or other application documents within a non-extendable time limit of one month after notification of the present communication (R. 109 EPC).

The claims applicable on expiry of the above time limit, i.e. those filed on entry into the European phase or in response to the present communication, will form the basis for the calculation of any claims fee to be paid (see page 2) and for any supplementary search to be carried out under Article 157(2) EPC (R. 109 EPC).

**(2) Claims fees under Rule 110 EPC**

If the application documents on which the European grant procedure is to be based comprise more than ten claims, a claims fee shall be payable for the eleventh and each subsequent claim within the period provided for in Rule 107(1) EPC.

Based on the application documents currently on file, all necessary claims fees have already been paid (or the documents do not comprise more than 10 claims).

All necessary fees will be/have been debited automatically according to the automatic debit order.

The claims fees due for the claims ..... to ..... were not paid within the above-mentioned period.

Any non-paid claims fee, either based on the current set of claims or on any amended claims to be filed pursuant to Rule 109 EPC (see page 1), may still be validly paid within a non-extendable period of grace of one month after notification of this communication.

If a payment is made for only some of the claims, it must be indicated for which claims it is intended. If a claims fee is not paid in due time, the claim concerned is deemed to be abandoned (R. 110(4) EPC).

If claims fees have already been paid, but on expiry of the above-mentioned time limit there is a new set of claims containing fewer fee-incurring claims than previously, the claims fees in excess of those due under Rule 110(2), 2nd sentence, EPC will be refunded (R. 110(3) EPC).

You are reminded that any supplementary search under Article 157(2) EPC will relate only to the last set of claims applicable on expiry of the above time limit AND will be confined to those fee-incurring claims for which fees have been paid in due time.

**The fee for the eleventh and each subsequent claim is EUR 40,00.**

Any additional representative(s) is/are listed here:

**3. Authorisation**

An individual authorisation is attached.

A general authorisation has been registered under No:

A general authorisation has been filed, but not yet registered.

The authorisation filed with the EPO as PCT receiving Office expressly includes the European phase.

**4. Request for examination**

Examination of the application under Art. 84 EPC is hereby requested. The examination fee is being (has been, will be) paid.

Request for examination in an admissible non-EPO language:

Verzoekt wordt om onderzoek van de aanvraag als bedoeld in Art. 94.

---

**5. Copies**

One or more additional sets of copies of the documents cited in the supplementary European search report are hereby requested.

Number of additional sets of copies

---

**6. Documents intended for proceedings before the EPO**

6.1 Proceedings before the EPO as designated Office (PCT I) are to be based on the following documents:

the application documents published by the International Bureau (with all claims, description and drawings), where applicable with emended claims under Art. 19 PCT

unless replaced by the emendments attached.

*Where necessary, clarifications should be attached as 'Other Documents'*

6.2 Proceedings before the EPO as elected Office (PCT II) are to be based on the following documents:

the documents on which the International preliminary examination report is based, including any annexes

unless replaced by the emendments attached.

*Where necessary, clarifications should be attached as 'Other Documents'*

If the EPO as International Preliminary Examining Authority has been supplied with test reports, these may be used as the basis of proceedings before the EPO.

---

**7. Translations**

Translations in one of the official languages of the EPO (English, French, German) are attached as crossed below:

\* *In proceedings before the EPO as designated or elected Office (PCT I + II):*

Translation of the International application (description, claims, any text in the drawings) as originally filed, of the abstract as published and of any indication under Rule 13bis.3 and 13bis.4 PCT regarding biological material

Translation of priority application(s)

It is hereby declared that the International application as originally filed is a complete translation of the previous application (Rule 38(5) EPC)

\* *In addition, in proceedings before the EPO as designated Office (PCT I):*

Translation of emended claims and any statement under Art. 19 PCT, if the claims as emended are to form the basis for the proceedings before the EPO (see Section 6).

\* *In addition, in proceedings before the EPO as elected office (PCT II):*

Translation of annexes to the International preliminary examination report

---

---

**8. Biological material**

The Invention relates to and/or uses biological material deposited under Rule 28 EPC.

The particulars referred to in Rule 28(1)(c) EPC (if not yet known, the depositary institution and the identification reference(s) [number, symbols, etc.] of the depositor) are given in the International publication or in the translation submitted under Section 7 on:

page(s) / line(s)

A copy of the receipt(s) of deposit issued by the depositary institution

is attached

will be filed at a later date

A waiver of the right to an undertaking from the requester pursuant to Rule 28(3) EPC is attached.

---

**9. Nucleotide and amino acid sequences**

The items required under Rules 5.2 and 13ter PCT and Rule 111(3) EPC have already been furnished to the EPO.

The sequence listing as part of the description is attached in PDF format.

The sequence listing does not include matter that goes beyond the content of the application as filed.

In addition, the sequence listing data is attached in computer-readable form in accordance with WIPO Standard 25.

The sequence listing data in computer-readable form in accordance with WIPO Standard 25 is identical to the sequence listing in PDF format.

---

**10. Designation fees**

10.1 It is currently intended to pay seven times the amount of the designation fee. The designation fees for all the EPC contracting states designated in the International application are thereby deemed to have been paid (Art. 2 No. 3 RFees).

AT BE BG CH&LI CY CZ DE DK EE ES FI FR GB GR HU IE IT LU MC NL PL PT RO SE SI SK TR

10.2 The declaration in No. 10.1 does not apply. Instead, it is currently intended to pay fewer than seven designation fees for the following EPC contracting states designated in the International application:

It is requested that no communications under Rule 106(3) EPC be issued in respect of any contracting states not indicated.

10.3 If an automatic debit order has been issued (Section 12), the EPO is authorised, on expiry of the basic period under Rule 107(1)(d) EPC, to debit seven times the amount of the designation fee. If states are indicated in No. 10.2, the EPO will debit designation fees for those states only, unless instructed otherwise before the basic period expires.

---

---

**11. Extension of the European patent**

---

This application is also considered as being a request for extension to all the non-contracting states to the EPC designated in the International application with which "extension agreements" were in force on the date of filing this International application. However, the extension only takes effect if the prescribed extension fee is paid.

It is currently intended to pay the extension fee for the following states:

---

**12. Automatic debit order**

---

Currency

EUR

The EPO is hereby authorised, under the Arrangements for the automatic debiting procedure, to debit from the deposit account below any fees and costs falling due. For designation fees, see "States". The EPO is also authorised, on expiry of the basic period for paying the extension fees, to debit those fees for each of the "extension states" indicated in "States".

## METHOD OF MEASURING SUB-MICRON TRENCH STRUCTURES

### FIELD OF THE INVENTION

The invention relates to the field of optoacoustic metrology to determine properties of a sample, e.g., a trench structure fabricated on a silicon wafer.

### BACKGROUND AND SUMMARY OF THE INVENTION

Fabrication of microelectronic devices typically includes multiple patterning steps wherein trench structures (i.e., holes or linear trenches) are fabricated, typically by etching, in a semiconductor substrate or thin film layers deposited on the substrate.

Non-contact optical methods of measuring such structures are in great demand for industrial process monitoring and control. Parameters of most interest for process control applications can include depth, width, and other parameters of the trench structures. In the state-of-the art integrated circuit manufacturing, typical width of the trench structures is of the order of  $0.1\mu\text{m}$ , while the depth of the trenches may range from under  $1\mu\text{m}$  to a few microns or more. Non-destructive measurement of such narrow high aspect ratio structures is a challenging problem.

In one known method, described in the prior art U.S.

---

Patents 5,812,261, 6,081,330, 6,188,478, herein incorporated by reference, a thin film structure is probed using an impulsive stimulated thermal scattering (ISTS) surface acoustic wave spectrometer. As shown in Fig. 1, in this technique, the sample structure 1 is excited with a short pulse of laser light imaged to form a grating pattern 10 on the sample surface by the interference of two beams 3,3'. Absorption of light under each of the bright stripes of the grating pattern 10 causes local heating of the sample, which results in sudden periodic expansion launching acoustic waves at the sample surface. The acoustic wave propagation can be seen in enlarged portion 8. As this surface acoustic wave (SAW) propagates in the plane of the film, it also modulates the diffracted signal beam 6' intensity, resulting in an oscillatory component (henceforth "acoustic component") in the detected signal.

The above-described technique has been employed to measure the thickness of film layers by analysis of the SAW frequency spectrum.

If a film is patterned, i.e., by etching, ISTS is useful for measuring the etch depth if the size of the etched area is large compared to the SAW wavelength (i.e., typically 2-10  $\mu\text{m}$ ). This prior art method will not work for measurement of a surface profile of a bulk sample, such as a silicon wafer. In addition, it is the smaller features (i.e., on the order of 0.1  $\mu\text{m}$ ) that

are most likely to be misprocessed during lithography and etching. Consequently, these relatively small features require process control metrology.

In one extension of the ISTS technique described in U.S. patent 6,256,100, the method described above is applied to measure the effective thickness of composite structures formed of narrow (i.e. micron or submicron width) trenches etched in dielectric material and filled with metal. However, this method had not been applied to measuring trench structures prior to metal filling.

In addition, no studies have been done for high-aspect-ratio sub-micron structures which are of the most interest for practical applications.

Accordingly, it would be desirable to provide a method that can measure trench structures on the order of 0.1  $\mu\text{m}$  in width.

The present invention meets the need for a method that can measure trench structures on the order of 0.1  $\mu\text{m}$  at least in one aspect. In one aspect, a method measures a patterned structure. One step of the method is exciting the structure by irradiating it with a spatially periodic laser intensity pattern in order to generate surface acoustic waves. Other steps are diffracting a probe laser beam off a thermal grating to form a signal beam; detecting the signal beam as a function of time to generate a signal waveform; and determining at least one property of the

patterned structure based on the effect of the surface profile on surface acoustic wave phase velocity.

In one embodiment, the spatially periodic laser intensity pattern has a period ranging from 1 to 20 microns. In another embodiment, the patterned structure has a surface profile with a period equal to or less than approximately 2  $\mu\text{m}$ .

In one embodiment, the patterned structure is a periodic array of trenches. In another embodiment, the periodic array is a periodic array of linear trenches. In yet another embodiment, the periodic array is a two-dimensional array of trenches.

In one embodiment, the trenches are fabricated in a silicon substrate. In another embodiment, the trenches are fabricated in a thin film.

In one embodiment, the at least one property is trench depth. In another embodiment, the at least one property is trench width. In another embodiment, the at least one property is a depth profile of the trench structure.

In one embodiment, the determining step includes combining measurements at multiple acoustic wavelengths to determine multiple parameters of the trench structure. In another embodiment, the determining step includes measurements along and across the linear trench structure to determine both trench depth and width. In still another embodiment, the determining step includes measurements both within and outside the patterned

area in order to separate the effect on the surface acoustic wave velocity caused by the trench structures from the other effects such as film thickness.

In one embodiment, the determining step includes analysis of the signal waveform with a theoretical model based on elastic properties of the structure. In another embodiment, the determining step includes analysis of the signal waveform with an empirical calibration.

The invention provides many advantages that are evident from the following description, drawings, and claims.

#### BRIEF DESCRIPTION OF THE DRAWING

The invention may be more completely understood in reference to the following figures:

Fig. 1 depicts a thin film structure on an integrated circuit probed using impulsive stimulated thermal scattering according to a prior art method;

Fig. 2a depicts a patterned film on a silicon substrate;

Fig. 2b depicts a patterned silicon substrate;

Fig. 3 depicts a matrix indicating calculated dependence of the SAW velocity on trench depth in silicon;

Fig. 4 depicts a matrix indicating calculated dependences of the SAW velocity on trench depth for 1  $\mu\text{m}$ -thick thermal oxide film on a silicon substrate;

Fig. 5 depicts a structure including a silicon substrate, a trench array etched in a  $\text{SiO}_2$  film, and a metal film coating;

Fig. 6 depicts signal waveforms generated outside of the patterned area of a sample depicted in Fig.5, parallel to the trenches of a trench array, and perpendicular to the trenches;

Fig. 7 depicts a table listing SAW velocity values obtained from the signal waveforms shown in Fig.6.

#### DETAILED DESCRIPTION OF THE INVENTION

According to the current invention, ISTS can be used to measure trench structures with near- or sub-micron width, e.g. a periodic array of trenches etched either in a thin film or in a silicon substrate. The measurement is based on the fact that the SAW phase velocity is affected by the trench structure and is dependent on the parameters of the structure.

According to the invented method, the excitation and detection of SAWs is performed on a patterned sample with surface profile characterized by a period of the order or less than 1  $\mu\text{m}$ . The measurement yields the SAW frequency at a defined wavelength, from which the SAW phase velocity is calculated. The data are analyzed with the help of an analytical or empirical model to determine a parameter of the profile, typically the trench depth or width.

---

Accurate analysis of SAW propagation in high aspect ratio trench structures will require finite element calculations. An approximate model can be used in order to obtain an estimate of the effect of high aspect ratio trench array on SAW propagation. The model applies to periodic arrays of linear trenches, such as those labeled 30 and 40 in Fig. 2, with the surface acoustic wave 2 period large compared to the period of the trench structure. Structure (a) of Fig. 2 depicts a periodic array of trenches 30 formed in a thin layer 60 over a substrate 70. Structure (b) of Fig. 2 depicts a periodic array of trenches 40 formed in a silicon substrate. Structure (a) includes a trench 9 on the order of tens of microns. This can be measured by a prior art ISTS method.

The model assumes that if the period of the structure (a) or (b) is small with respect to both SAW 2 wavelength and thickness of the structure, it can be treated as a homogeneous material with effective elastic properties. It is known to calculate the effective elastic properties of a layered structure from the properties of constituent materials, such as in structure (a). The layered structure is effectively described as a transversely isotropic medium with the symmetry axis perpendicular to the layers, which is described by 5 independent effective elastic constants. The same method can be applied to a trench array 30, 40 if vacuum is treated as one of

the constituent materials of the structure. Thus, the following equations expressing effective density  $\rho^*$  and elastic constants  $C_{ij}^*$  of the trench array through the density  $\rho$  and elastic constants  $C_{ij}$  of the material can be obtained:

$$\begin{aligned}\rho^* &= h\rho \\ C_{11}^* &= h \left( C_{11} - \frac{C_{12}^2}{C_{11}} \right) \\ C_{66}^* &= h C_{44} \\ C_{13}^* = C_{33}^* = C_{44}^* &= 0\end{aligned}\tag{1}$$

where  $h$  is the ratio of the space between the trenches to the period of the structure. It can be expressed through the trench width/space ratio as  $h=1/(1+w/s)$ . The notations in equation (1) assume that the  $z$ -axis is perpendicular to the trenches.

Fig. 3 presents the calculated dependence of the SAW velocity on the trench depth for trench arrays with width/space ratios 1:1 and 1:3 fabricated in Si. Fig. 4 depicts the calculated dependence of the SAW velocity on the trench depth for trench arrays in a 1  $\mu\text{m}$ -thick silicon dioxide film on Si. The calculations show that there is a significant dependence of the SAW velocity on both the trench depth  $80$  and width/space ratio, particularly for SAW propagation across the trenches. In order to estimate the repeatability of the trench depth  $80$  measurements, assume that the repeatability of the SAW velocity measurements are  $\sim 0.5$  m/s (which corresponds to the frequency

measurement repeatability of 0.1 MHz). For a trench depth of 5000 Å and SAW propagation perpendicular to the trenches, the results presented in Figs. 3 and 4 yield a repeatability estimate of ~7 Å (or 0.14%) for 1:1 width/space ratio trenches in Si and ~20 Å (or 0.4%) for trenches in the oxide film.

It should be noted that variations in trench depth 80 and width 90 have different effects on SAW velocity parallel (||) and perpendicular (⊥) to the trenches 5. An increase in the trench width 90 increases the parallel velocity but decreases the perpendicular velocity while an increase in the trench width/space ratio increases the SAW velocity in both directions. This fact indicates that the measurements with SAW propagation along and across the trenches 5 can be combined in order to determine both trench depth 80 and width ratio.

Although the model calculations above applied to a one-dimensional array of linear trenches, it is expected that two-dimensional array of holes will also have an effect of a on the SAW velocity that can be used to measure the parameters of the structure such as trench depth and width.

Performing measurements at multiple SAW wavelengths will provide additional information that can be used for simultaneous measurements of multiple parameters of trench structures. For example, if the SAW wavelength is small compared to the trench depth, SAW velocity will be independent on the trench depth, but

still sensitive to the trench width. At longer wavelength, SAW velocity will be sensitive to both trench depth and width. Combining the measurements at short and long wavelengths will thus allow to measure both parameters simultaneously.

To test the capability of trench measurements with the invented method experimentally, we performed measurements on a structure depicted in Fig. 5 at a SAW wavelength 6  $\mu\text{m}$ . The structure of Fig. 5 includes a substrate 700 formed of silicon, a trench array 500 fabricated in an 800 nm-thick layer of  $\text{SiO}_2$ . The trench width was 1  $\mu\text{m}$  and the width/space ratio was 1:1. The structure was coated with a -25 nm of Ta and -100 nm of Cu 600.

Fig. 6 presents the signal waveforms 600 obtained in the unpatterned area of the sample and on the trench array 601, 602 of Fig. 5 with SAW propagation parallel (e.g., 601) and perpendicular (e.g., 602) to the trenches 5. It can be seen from the waveforms 600, 601, 602, that for the perpendicular propagation, the effect of the surface relief on the signal is particularly strong and that it causes a significant decrease in the SAW frequency.

Fig. 7 presents a table listing SAW velocity values obtained from the waveforms shown in Fig. 6. One can see that for the parallel propagation, the SAW velocity increases slightly compared to unpatterned area (i.e. zero trench depth), while for perpendicular propagation the velocity decreases significantly.

---

These results qualitatively agree with the theoretical predictions according to Fig.4.

The invention provides many additional advantages that are evident from the description, drawings, and claims.

The preceding expressions and examples are exemplary and are not intended to limit the scope of the claims that follow.

What is claimed is:

1. A method for measuring a patterned structure (3) comprising:
  - exciting the structure (3) by irradiating it with a spatially periodic laser intensity pattern in order to generate surface acoustic waves.
  - diffracting a probe laser beam (6) off the thermal grating to form a signal beam;
  - detecting the signal beam as a function of time to generate a signal waveform; and
  - determining at least one property of the patterned structure based on the effect of the surface profile on surface acoustic wave phase velocity.
2. The method of Claim 1, wherein the exciting step further comprises a spatially periodic laser intensity pattern having a period ranging from 1 to 20 microns.
3. The method of Claim 1, wherein the patterned structure is comprised of trenches equal to or less than approximately 2  $\mu\text{m}$  in width.
4. The method of Claim 3, wherein the patterned structure further comprises a periodic array of trenches.

5. The method of Claim 4, wherein the patterned structure further comprises a periodic array of linear trenches.
6. The method of Claim 4, wherein the patterned structure further comprises a two-dimensional periodic array of trenches.
7. The method of Claim 4, wherein the trenches are fabricated in a silicon substrate.
8. The method of Claim 3, wherein the trenches are fabricated in a thin film.
9. The method of Claim 1, wherein the at least one property comprises trench depth.
10. The method of Claim 1, wherein the at least one property comprises trench width.
11. The method of Claim 1, wherein the at least one property comprises a depth profile of the trench structure.
12. The method of Claim 1, wherein the determining step further comprises combining measurements at multiple acoustic

wavelengths to determine multiple parameters of the trench structure.

13. The method of Claim 5, wherein the determining step further comprises combining measurements along and across the trench structure to determine both trench depth and width.

14. The method of Claim 1, wherein the determining step further comprises combining measurements within and outside the patterned area to separate the effect on the surface acoustic wave velocity caused by the trench structure from the other effects such as film thickness.

15. The method of claim 1, wherein the determining step comprises analysis of the signal waveform with a theoretical model based on elastic properties of the structure.

16. The method of Claim 1, wherein the determining step comprises analysis of the signal waveform with a model based on an empirical calibration.

---

#### ABSTRACT

The present invention uses ISTS to measure trenches with near- or sub-micron width. The trenches can be etched in a thin film on in a silicon substrate. One step of the method is exciting the structure by irradiating it with a spatially periodic laser intensity pattern in order to generate surface acoustic waves. Other steps are diffracting a probe laser beam off the thermal grating to form a signal beam; detecting the signal beam as a function of time to generate a signal waveform; determining surface acoustic wave phase velocity from the waveform; and determining at least one property of the trench structures based on the dependence of surface acoustic wave phase velocity on the parameters of the structure.

**5. PRESENT STATE OF THE ART**

Briefly describe the closest already-known technology that relates to the invention. This would include, for example, already existing products, methods or compositions which are known to you personally or through descriptions in publications.

1. ISTS technique implemented in Philips Analytical's Impulse/Emerald instruments is primarily used for film thickness measurement. It would be straightforward to use this technique to measure the etch depth of a film on a substrate if the size of the etched area is of the order of or larger than the probe laser spot i.e. typically  $\geq 30 \mu\text{m}$ , in which case such measurement will be equivalent to measuring the film thickness inside and outside the etched area.

2. Scanning atomic force microscopy (AFM) is used to measure profile of sub-micron structures. 3. Scatterometry (measurement of the angular distribution of light scattered by the structure) is used to measure the surface profile of sub-micron structures. Unlike AFM, this is an indirect method based on the mathematical modeling of light scattering, and the feature size should be larger than at least a half of the optical wavelength.

4. An effect of periodic surface relief on the velocity of SAWs measured by the ISTS technique has been previously observed (see L. Dhar and J.A. Rogers, Appl. Phys. Lett. 77, 1402 (2000)). However, it has not been proposed that the method could be used to measure the etch profile depth.

**6. ADVANCEMENT IN STATE OF THE ART**

Briefly describe the unique advancement achieved by the invention. This may be done, for example, by describing a problem with the prior art that is solved or specific objects that are achieved by the invention.

1. Unlike AFM and scatterometry, the proposed method does not have limitations related to high aspect ratio or small feature size of the structure
2. Compared to AFM, the method has an advantage of being an all-optical technique providing faster measurements and more suited for in-line process control. The profile depth is obtained in a single measurement vs. a linear scan needed in a measurement by AFM
3. Compared to scatterometry, the method has an advantage of simple and straightforward data analysis. The only measured parameter is the SAW frequency. Typically, the smaller the frequency, the larger is the profile depth.
4. The invention extends the range of applications of Impulse/Emerald film thickness measuring instruments.

## M asuring d epth of sub-micron tr ench arrays by ISTS

### I. Outline of the m ethod.

In the prior art, laser-induced transient grating technique, or ISTS, has been used to measure film thickness via measuring the phase velocity of Surface Acoustic Waves (SAWs) propagating in the filmstack. If the film is patterned e.g. by etching, it would be straightforward to use ISTS for measuring the etch depth if the size of the etched area is large compared to the SAW wavelength (typically 2-10  $\mu\text{m}$ ). In this case measuring the etch depth means simply measuring a change in the film thickness (see Fig.1). Note that it can only be done for a thin film on a substrate made of different material so that the SAW velocity be dependent on the film thickness. The prior art method will not work at all if one needs to measure surface profile of a bulk sample, e.g. a silicon wafer.

In the state-of-the-art integrated circuit manufacturing, typical pattern feature size is of the order of 0.1  $\mu\text{m}$  i.e. much less than the SAW wavelength in an ISTS measurement. Although larger features may be also present within a die, it is the smallest features that are most likely to be misprocessed during lithography and etching, and, consequently, require process control metrology. According to the current invention, ISTS can be used to measure depth profile of a periodic structure with near- or sub-micron feature, e.g. a periodic array of trenches etched either in a thin film or in a silicon substrate (see Fig.1). The measurement is based on the fact that the SAW phase velocity is affected by periodic surface relief. This effect have been reported previously [1-2], but the application of the effect to measuring surface profile has not been proposed. Also, no studies have been done for high-aspect-ratio sub-micron structures which are of the most interest for practical applications.

According to the invented method, the measurement process is similar to an ISTS measurement known from the prior art, except of the fact that the excitation and detection of SAWs is performed on a patterned sample with surface profile characterized by a period of the order or less than 1  $\mu\text{m}$ . The measurement yields the SAW frequency at a defined wavelength, from which the SAW phase velocity is calculated. The data are analyzed with the help of an analytical or empirical model to determine a parameter of the profile, typically the trench depth or width / space ratio.

## II. Theoretical model for high aspect ratio trench arrays.

Previous theoretical work [1] was done for shallow surface relief permitting the use of perturbative approaches. Accurate analysis of high aspect ratio structures would require finite element calculations. Here, we are considering an approximate model in order to obtain at least an estimate of the effect of high aspect ratio trench array on SAW propagation. The model applies to periodic arrays of trenches such as those shown in Fig. 1, with the period smaller than the trench depth. The model assumes that if the period of the structure is small with respect to both SAW wavelength and thickness of the structure, the structure can be treated as a homogeneous material with effective elastic properties. In Ref. [3], it was shown how to calculate the effective elastic properties of a layered structure from the properties of constituent materials. The layered structure is effectively described as a transversely isotropic medium with the symmetry axis perpendicular to the layers, which is described by 5 independent effective elastic constants. The same method can be applied to a trench array if vacuum is treated as one of the constituent materials of the structure. From the equations of Ref.[3], we obtain the following equations expressing effective density  $\rho^*$  and elastic constants  $C_{ij}^*$  of the trench array through the density  $\rho$  and elastic constants  $C_{ij}$  of the material:

$$\begin{aligned}\rho^* &= h\rho \\ C_{11}^* &= h \left( C_{11} - \frac{C_{12}^2}{C_{11}} \right) \\ C_{66}^* &= h C_{44} \\ C_{13}^* &= C_{33}^* = C_{44}^* = 0\end{aligned}\quad (1)$$

where  $h$  is the ratio of the space between the trenches to the period of the structure. It can be expressed through the trench width/space ratio as  $h=1/(1+w/s)$ . The notations in Eq.(1) assume that the  $z$ -axis is perpendicular to the trenches.

For SAW propagation along the  $x$ -axis i.e. along the trenches, a transversely isotropic medium with the  $z$  symmetry axis is equivalent to an isotropic medium and the only elastic constants that matter are  $C_{11}^*$  and  $C_{66}^*$ . Therefore, a standard computer code for SAW propagation in a film/substrate structure can be used to analyze this case. Analysis of the propagation across the trenches is more complicated because some acoustic velocities are equal to zero and the standard code cannot handle the situation. For this case, I did a simplified analysis, modeling a trench array as a mass loading lacking any elastic strength.

Fig. 2 presents the calculated dependence of the SAW velocity on the trench depth for trench arrays with width/space ratios 1:1 and 1:3 fabricated in Si and in a 1  $\mu\text{m}$ -thick thermal oxide film on

Si. The calculations were done for SAW wavelength 6  $\mu\text{m}$ . The calculations show that there is a significant dependence of the SAW velocity on both the trench depth and width/space ratio, particularly for SAW propagation across the trenches. In order to estimate the repeatability of the trench depth measurements, let us assume that the repeatability of the SAW velocity measurements is  $\sim 0.5$  m/s (which corresponds to the frequency measurement repeatability of 0.1 MHz). For a trench depth of 5000  $\text{\AA}$  and SAW propagation perpendicular to the trenches, the results presented in Fig.(2) yield a repeatability estimate of  $\sim 7$   $\text{\AA}$  (or 0.14%) for 1:1 width/space ratio trenches in Si and  $\sim 20$   $\text{\AA}$  (or 0.4%) for trenches in the oxide film.

It should be noted that variations in trench depth and width have different effects on SAW velocity parallel and perpendicular to the trenches. An increase in the trench width increases the parallel velocity but decreases the perpendicular velocity while an increase in the trench width/space ratio increases the SAW velocity in both directions. This fact indicates that the measurements with SAW propagation along and across the trenches could be combined in order to determine both trench depth and width/space ratio.

### III Experiment

Experiment was done at an acoustic wavelength of 6  $\mu\text{m}$  on an array of 1  $\mu\text{m}$ -wide trenches with 1:1 width/space ratio etched in an 8000  $\text{\AA}$ -thick layer of CVD oxide on Si, and covered with  $\sim 250$   $\text{\AA}$  of PVD Ta and  $\sim 1000$   $\text{\AA}$  of PVD Cu (see Fig.3). Note that this structure does not correspond to the theoretical model considered above because of the presence of the metal coating and also because the aspect ratio of the trenches is not high enough and the structure period is not too small compared to the wavelength. Therefore, the experiment was performed not in order to quantitatively verify the theoretical model but rather in order to demonstrate that a structure with deep trenches yields a good signal for SAW propagation direction both parallel and perpendicular to the trenches and also that there is a significant effect of the surface profile on the SAW velocity.

Fig. 4 presents the signal waveforms obtained in the unpatterned area of the sample and on the trench array with SAW propagation parallel and perpendicular to the trenches. It can be seen from the waveforms, that for the perpendicular propagation, the effect of the surface relief on the signal is particularly strong and that it causes a significant decrease in the SAW velocity. Table 1 lists the values of the SAW velocity obtained from the measured waveforms. The fact that the presence of the trenches increases the SAW velocity for the parallel propagation and decreases it for the perpendicular propagation qualitatively agrees with the theoretical model.
